

'Survival in a Changing World'

The Journal of
**Experimental
 Biology**

Climate change has already significantly impacted the habitats and living conditions of many species, including our own. Anthropogenic pollution and myriad releases of biologically active substances into the environment have further changed the world for living organisms. This special issue aims to assess the impacts many of these changes have had on animal biodiversity and ecology, emphasizing adaptation and resilience in physiological systems.

Featuring articles on:

- Global warming and the Arctic
- Climate change and its influence on terrestrial and aquatic animals
- Emerging zoonosis and human diseases
- Animal resilience and adaptation in coping with changes
- Individual, population and ecosystem responses to disease, contaminants and climate change

Contributing authors include:

- **Jeff Bale** (University of Birmingham, UK)
- **Drew Harvell** (Cornell University, USA)
- **Ary Hoffman** (University of Melbourne, Australia)
- **Pieter Johnson** (University of Colorado, Boulder, USA)
- **Glen MacDonald** (University of California, Los Angeles, USA)
- **Laura Mydlarz** (University of Texas, Arlington, USA)
- **Hans Otto Pörtner** (Alfred-Wegener-Institute, Germany)
- **George Somero** (Hopkins Marine Station, USA)
- **Lars Tomanek** (California Polytechnic State University, USA)
- **Shaun Wilson** (Dept of Environment and Conservation in Western Australia)

Published February 2010.
